Supplementary Tables

Table S1: Summary of patient-specific clinical data utilized in the study, including key parameters essential for modeling and analysis of flow dynamics and physiological conditions. Here, Dao: Descending aorta, LSVC: Left superior vena cava, RSVC: Right superior vena cava, LPA: Left pulmonary artery, RPA: Right pulmonary artery, BSA: Body surface area, F: Female, M: Male, and Arteriovenous Malformations.

Patient	MRI Measured Inflow (L/min)			MRI Measured Outflow (L/min)		BSA	Age (Years)	Sex	AVM
	DAo	LSVC	RSVC	LPA	RPA				
1	2.76	0.92	0.92	1.43	1.93	1.66	18.9	F	Yes
2	3.1	1.4	1.4	2.54	2.91	1.08	10.4	F	Yes
3	2.9	0.38	0.58	1.8	1.7	1.16	13.4	F	Yes
4	1.99	0.47	0.47	0.47	0.47	1.69	21	F	Yes
5	4.5	0.765	0.765	17 mmHg*	16 mmHg*	1.52	14.9	M	Yes
6	5.72	1.045	1.045	3.7	3.8	1.5**	17.9	M	Yes
7	2.3	0.75	0.5	1	2.2	1.5**	8	M	Yes
8	1.0395	0.594	0.594	14 mmHg*	15mmHg*	0.66	4.5	N/A	No
9	1.04	0.6	1.48	1.44	0.83	0.679	5.42	M	No
10	3.8	2.435***	2.435***	1.95	3.85	1.626	18.76	M	Yes
11	1.19	0.905***	0.905***	0.94	1.08	0.690	5.17	M	No
12	0.4	1.5	0.5	0.9	1.1	0.727	4.17	F	N/A
13	0.9	1***	1***	0.6	2.2	0.667	3.75	F	N/A
14	1.03	1.28***	1.28***	2.55	0.92	0.765	5.84	F	N/A
15	1.36	1.08	2.01	0.98	1.35	0.839	5.59	M	N/A
16	3.1	0.5	1	1.4	2.6	1.607	24.77	F	N/A
17	3.5	0.9	1.6	1.9	2.5	1.719	21.1	F	N/A

Assumptions: *In the absence of specific split values for the LPA and right pulmonary artery RPA from the MRI report, for Patient 5, the flow split between the LPA and RPA was calculated based on the pressures at the respective outlets (LPA: 17 mmHg and RPA: 16 mm Hg, as per the Cath report). The total body flow was distributed according to the ratio of the pressures at the LPA and RPA outlets, assuming that flow resistance is inversely proportional to the pressure at each outlet reflecting the vascular resistance. For patient 8, the pulmonary vascular resistance (PVR) of 1.1 indexed Wood units (equivalent to $5.79 \times 10^6 \text{ Pa} \cdot \text{s} \cdot \text{m}^{-3}$) provided in the Cath report for Patient 8 was used. **BSA values for patients 6 and 7 were estimated based on the upper-to-lower body flow ratios reported in the MRI. Specifically, a BSA of 0.5 was assigned for a ratio of 2, a BSA of 1 for a ratio of 1, and a BSA of 1.5 for a ratio of 0.5. *** The flow measured at the SVC was evenly divided between the LSVC and RSVC.

Table S2: Shapiro-Wilk test for normality of PL, VDR, and VOR distribution corresponding to each body flow ratio. Here a P-Value > 0.05 indicates normal distribution.

Shapiro-Wilk Test				
Upper: Lower Body Flow = 2				
	Mean	SD	Statistics	P-Value
PL	18.8118	25.3245	0.7228	0.0002123

VDR	0.002395	0.002338	0.8137	0.003147
VOR	0.003646	0.002009	0.9429	0.3546
Upper: Lower Body Flow = 1				
PL	49.6159	63.8686	0.76	0.0006029
VDR	0.007586	0.006661	0.8714	0.02309
VOR	0.007235	0.00338	0.9113	0.1054
Upper: Lower Body Flow = 0.5				
PL	119.4	169.3213	0.6694	0.00005308
VDR	0.01757	0.01796	0.8092	0.00272
VOR	0.01123	0.005598	0.8986	0.06436
